

DANIEL WISEMAN

AI ENGINEER | PYTHON, LLM APIs, DOCUMENT AUTOMATION & HEALTHCARE SYSTEMS

San Francisco, CA | (818) 863-6443 | daniel.wiseman.ca@gmail.com

PROFESSIONAL SUMMARY

Software engineer with 10+ years building production systems across healthcare, enterprise SaaS, and infrastructure, including Python services, relational databases, OpenAI API integrations, and document automation. Developed an evidence-first AI resume platform that processes PDF/DOCX inputs, requests structured JSON from an LLM, validates generated claims against source facts, and produces user-ready documents. Brings HIPAA-aware engineering judgment, hands-on delivery, and a record of improving performance, reliability, and release speed in systems used by millions.

CORE SKILLS

AI & Document Engineering: OpenAI API, prompt design, structured JSON output, LLM output validation, document processing, PDF/DOCX parsing and generation, NLP, data preprocessing

Programming & APIs: Python, FastAPI, Django, Flask, Node.js, REST APIs, GraphQL, asynchronous services, microservices

Data: SQL, Microsoft SQL Server, PostgreSQL, MySQL, MongoDB, database design, multi-table queries, query optimization

Reliability & Delivery: Pytest, automated testing, guardrails, audit logging, monitoring, Git, GitHub Actions, CI/CD, Docker, Kubernetes, Terraform

Cloud & Regulated Systems: Azure, AWS, HIPAA, PHI/PII security, healthcare systems, FHIR, HL7, EHR and clinical workflows

SELECTED AI ENGINEERING PROJECT

Job Bot | AI Engineer / Full-Stack Developer | Independent Project

2026

- Built a production-style FastAPI and React application that accepts PDF and DOCX resumes, tailors content to a job description with the OpenAI API, and returns ATS-ready DOCX/PDF outputs.
- Implemented structured JSON generation and parsing for resume and cover-letter workflows, converting unstructured candidate and job data into deterministic, application-ready sections.
- Engineered evidence-first guardrails that map claims to source facts, reject unsupported technologies or metrics, report qualification gaps, and prevent an LLM from converting adjacent experience into false claims.
- Created 40 automated tests covering evidence validation, unsupported-claim filtering, skill transfer logic, metric preservation, and document-processing behavior.
- Containerized the full-stack service with Docker and configured production deployment, including LibreOffice-based DOCX-to-PDF conversion and health/configuration checks.

PROFESSIONAL EXPERIENCE

CVS Health | Senior Software Engineer | Remote

01/2022 - 03/2026

- Built and maintained production services for a unified digital health platform integrating pharmacy, insurance, and care workflows for 15M+ registered members.
- Engineered Node.js microservices and API gateways for prescription fulfillment, eligibility, and identity workflows, improving peak-load response times by 29%.
- Improved sustained concurrent-user capacity by 34% through targeted caching and backend concurrency work; maintained 99.9% message-delivery reliability across Kafka pipelines.
- Reduced deployment lead time by 78% using Docker, Kubernetes, Terraform, and automated test/release pipelines while improving release stability.
- Established HIPAA-aligned access controls, encrypted service communication, and audit logging for systems handling patient and member data.

Dignity Health | Senior Software Engineer

08/2018 - 12/2021

- Developed patient-facing and internal healthcare platforms supporting clinical, pharmacy, and retail workflows across hospitals serving millions of patients annually.
- Designed Node.js APIs and event-driven integrations across EHR, prescription, and retail systems, increasing peak transaction throughput by 36% and reducing cross-system data inconsistencies by 33%.
- Tuned multi-system queries and service contracts across PostgreSQL and Microsoft SQL Server, improving response times by 35% for critical clinical and pharmacy endpoints.
- Standardized automated testing and release pipelines, lowering production incidents by 42% while increasing deployment frequency and reliability.

- Applied HIPAA-aligned access control, auditing, and data-protection practices to applications handling PHI and clinical information.

Meter | Backend Engineer

06/2015 - 07/2018

- Built production backend services and REST APIs for a cloud-managed networking platform supporting secure provisioning and management of 2,000+ devices.
- Developed Kafka telemetry pipelines ingesting millions of network events daily, improving observability and troubleshooting efficiency by 41%.
- Created authentication, authorization, and configuration-validation services that reduced misconfiguration-related outages by 32%.
- Operated containerized AWS services with Terraform, sustaining 99.9% uptime during continuous delivery and customer expansion.

EDUCATION

California Polytechnic State University, San Luis Obispo | Bachelor of Science, Computer Science | 05/2015 | GPA: 3.63
